

ABBy™ in the Marketplace

Although Retentus® products are being used in over 850 hospitals, the following is anecdotal evidence as to the effectiveness of ABBY as a post-op wound care device.

1. To date, over 3,000 patients have worn the ABBY retractor without a reported post-op infection or dermis issues.
2. Currently, a hospital in Minnesota is concluding a white paper study of 100 patients. Results will be available shortly.
3. A Michigan hospital has written an IRB study and received approval for 150 patients, starting December 2019.
4. In Tennessee, a university medical center is currently writing an IRB for approval of a 250-patient study.
5. Over 100 hospitals have used the ABBY, most report a reduction of post-op pain. All report no infections and an increase in patient satisfaction.

In the age of evidentiary medicine, we currently have only anecdotal evidence of the effectiveness of the ABBY. We are confident the on-going and soon to commence studies will further substantiate the efficacy of the ABBY post-op retractor.

Should you desire, we would be happy to provide director contacts, so you may discuss the effectiveness of the ABBY with a current user.
